SkilloVilla AI Programme

Project 4 — AI-Powered Micro Digital Business System

AI Productivity Toolkit for Students

Complete Project Documentation — Tasks 1, 2 & 3

Task 1: AI Revenue-Focused Prompting System
Task 2: Visual AI System
Task 3: n8n Lead Handling Automation

Defined product components: Prompt Templates • Study Workflow Systems • AI-Assisted Planning Structures • Automation Blueprints
Price: ■499–■999 **Target:** Students interested in using AI for studying, planning, and workflows

This document consolidates the three completed tasks into one presentation-ready project record, including the refined sales messaging, five-scene visual narrative, n8n automation system, refinements, testing, visual evidence, and viva preparation.

1. Project Overview

The project builds an AI-powered micro digital business system around the **AI Productivity Toolkit for Students**. The system connects three layers: ethical sales messaging, a cinematic visual narrative, and an operational lead-handling automation.

The product contains exactly four defined components: **Prompt templates, Study workflow systems, AI-assisted planning structures, and Automation blueprints.** The project does not add unsupported product features.

The overall project flow is:

```
Buyer/Market Insight → Product Positioning → Sales Message → Visual Narrative → Student Preview Form → Automated Classification → Personalized Response → Email → Lead Update → Action Log
```

Task 1 establishes what to say. Task 2 establishes how to show it. Task 3 establishes how to handle a student response operationally.

2. Task 1 — AI Revenue-Focused Prompting System

Task 1 designed an iterative AI prompting architecture that moves from buyer research to positioning, persona simulation, objection handling, value/ROI framing, sales messaging, meta-critique, and two refinements.

Prompting architecture

Stage	Purpose	Result
1. Buyer / Market Analysis	Understand financial sensitivity, value, objections, trust and ROI.	Buyer/value insights
2. Product Positioning	Define the product and its distinction from free AI resources.	Core positioning
3. Persona Simulation	Test the offer from different student perspectives.	Motivations and objections
4. Objection Handling	Identify and ethically address purchase barriers.	Response strategy
5. Value & Economic ROI	Explain value without unsupported promises.	Ethical value/pricing strategy
6. Sales Messaging	Turn insights into sales copy.	Headline, narrative, 4 VPs, CTA
7. Meta-Critique	Evaluate the draft against quality criteria.	Strengths, weaknesses, recommendations
8. Refinement #1	Apply the critique.	Improved message
9. Refinement #2	Final quality refinement.	Final message

The buyer analysis identified financial sensitivity around ■499–■999, comparison with free AI, objections such as “I can create this myself with ChatGPT,” trust through clear previews and use cases, and ROI framing through potential time/effort reduction rather than guaranteed returns.

Core positioning: **“Don’t position it as ‘more AI prompts.’ Position it as an organized student productivity system built around AI.”**

3. Task 1 — Personas, Objections and Ethical Value

Persona	Motivation	Main objection	Relevant components
Riya — Curious Experimenter	Occasional AI user seeking organized use	Why pay when I can just ask ChatGPT?	Prompt templates; study workflows
Arjun — Busy Planner	Regular AI user seeking less repeated setup	Will I actually use these systems?	Planning; study workflows
Kabir — AI Power User	Technically comfortable; values depth and organization	What am I getting for ■999?	Automation; workflow systems

Major objection handling focused on explaining that the toolkit is not required for AI access. Its proposed value is organized, reusable structures that reduce the need to build every process from a blank chat.

Ethical value framing: reduced setup effort, organization, repeatability, convenience, and practical starting points. The project avoided guaranteed productivity, academic, financial, grade, time-saving, testimonial, scarcity, or superiority claims.

4. Task 1 — Final Sales Message

Final Headline: You Already Have AI. Now Use It With More Structure for Studying, Planning, and Workflows.

Final strategic narrative:

You already have access to AI. You can open ChatGPT to ask questions, understand topics, generate ideas, or create a study plan.

But having AI available doesn't automatically give you a structured way to use it across your everyday student tasks. Maybe you need to plan what to study, organize a recurring study process, or figure out how to approach a task with AI. You open a blank chat, decide what to ask, and build the process from scratch.

The AI Productivity Toolkit for Students gives you another starting point: organized structures you can review, adapt, and use according to your own needs.

It brings together four practical components: Prompt templates; Study workflow systems; AI-assisted planning structures; and Automation blueprints. The message explicitly explains that students do not need the toolkit to access AI; the value is the organized collection of reusable structures.

The toolkit is priced at ■499–■999, depending on the offering. Students can review the actual contents and examples before deciding whether the structures are relevant to the way they study, plan, and use AI.

Final CTA: Review the toolkit contents and examples, then decide whether these structures fit the way you study, plan, and use AI.

5. Task 1 — Four Value Propositions and Refinement

1. **Start with a ready-made prompt structure.** Use prompt templates as practical starting points you can adapt to your needs.

2. **Organize your AI-supported study process.** Use study workflow systems to give recurring study activities a defined structure.

3. **Bring a framework to AI-assisted planning.** Use planning structures as starting points for approaching planning tasks with AI.

4. **Explore structured AI workflow ideas.** Use automation blueprints as starting structures you can review and adapt to relevant workflows.

Meta-critique identified that the message was ethically strong but sometimes abstract. The refinement therefore made the blank-chat problem more concrete, connected each component to student use, clarified the product demonstration, and strengthened the CTA without adding larger promises.

The final outcome was an iterative system rather than a single copy-generation prompt: research informed positioning; positioning informed personas; personas informed objections; objections informed value framing; all findings informed sales messaging; critique informed refinement.

6. Task 2 — Visual AI System

Task 2 converted the Task 1 strategy into a five-scene cinematic advertising narrative. The required sequence is: **Problem** → **Hidden Cost of Inefficiency** → **Introduce Toolkit** → **Transformation** → **Purchase CTA.**

Core visual principle: the student already has access to AI. The problem is the lack of organized, reusable structures—not lack of AI access.

Character lock

Ananya is a 21-year-old Indian final-year college student with medium-brown skin, long straight dark-black hair, brown eyes, simple rectangular glasses, a navy-blue casual college shirt, dark jeans, and a simple wristwatch. Her identity, wardrobe, environment, lighting, and photographic style were kept consistent across scenes.

Visual style: photorealistic cinematic advertising photography, modern Indian student environment, natural indoor lighting, realistic skin and hair, shallow depth of field, premium commercial advertising aesthetic, with clean left-side negative space for later campaign copy.

7.1 Scene 1 — Problem

Ananya already has AI access but is uncertain about how to structure its use across everyday student tasks.

Refinement focus: character consistency, narrative progression, composition, emotional clarity, product-scope accuracy, and ethical claim control.

Final visual — Scene 1 — Problem.

7.2 Scene 2 — Hidden Cost of Inefficiency

The problem escalates into the friction of repeatedly figuring out prompts, planning, and workflows from scratch.

Refinement focus: character consistency, narrative progression, composition, emotional clarity, product-scope accuracy, and ethical claim control.

Final visual — Scene 2 — Hidden Cost of Inefficiency.

7.3 Scene 3 — Introduce Toolkit

The toolkit appears as the organized solution, showing only the four defined components.

Major refinement: the initial version showed extra subcategories that could be interpreted as invented product features. The final version was regenerated to show only Prompt Templates, Study Workflow Systems, AI-Assisted Planning Structures, and Automation Blueprints.

Final visual — Scene 3 — Introduce Toolkit.

7.4 Scene 4 — Transformation

Ananya actively reviews, adapts, and uses a structured AI-supported workflow. The transformation is realistic, not magical.

Refinement focus: character consistency, narrative progression, composition, emotional clarity, product-scope accuracy, and ethical claim control.

Final visual — Scene 4 — Transformation.

7.5 Scene 5 — Purchase CTA

Ananya confidently presents the toolkit, while clean left-side negative space remains for final campaign copy, price, and CTA.

Refinement focus: character consistency, narrative progression, composition, emotional clarity, product-scope accuracy, and ethical claim control.

Final visual — Scene 5 — Purchase CTA.

8. Final Five-Scene Storyboard

The storyboard image below combines the five scenes into one visual sequence. It demonstrates the complete emotional and narrative progression from uncertainty to confidence.

Combined five-scene storyboard: Problem → Hidden Cost → Introduce Toolkit → Transformation → Purchase CTA.

Emotional progression: **Uncertain** → **Frustrated** → **Curious** → **Focused/Confident** → **Confident.**

Cross-scene consistency checks confirmed the same character identity, navy-blue shirt, dark jeans, glasses and wristwatch, same modern Indian student environment, cinematic lighting, right-side subject placement, left-side copy space, and four-component product scope.

9. Task 3 — n8n Lead Handling Automation

Task 3 built the operational lead-handling layer. The system captures a free-preview request, prepares structured data, stores the lead in Google Sheets, categorizes the student's biggest productivity challenge, creates a personalized response, sends an email, updates the lead record, and logs the action.

```
Final architecture:

Form Submission → Prepare Student Data → Leads Google Sheet → Switch → Category Response → Email → Update Leads → Action Log
```

Stage	Node	Purpose
1	On form submission	Receives free-preview submission.
2	Prepare Student Data	Creates Category and Timestamp.
3	Append row in sheet	Stores the incoming lead.
4	Switch	Routes into one of four categories.
5	Response nodes	Creates category-specific response.
6	Send an Email nodes	Delivers personalized response.
7	Append or update row	Writes Response back to matching lead.
8	Action Log nodes	Records the follow-up action.

10. Task 3 — Form, Data and Google Sheets

The free preview form contains four required fields: Name, Email, College Year, and Biggest Productivity Challenge. The challenge options are Time Management, Lack of Focus, Overwhelm, and Tool Confusion.

Prepare Student Data creates:

```
Category = {{ $json["Biggest Productivity Challenge"] }}

Timestamp = {{ $now }}
```

The Google Sheets document **AI Productivity Toolkit — Leads** contains a Leads tab with Name, Email, College Year, Biggest Productivity Challenge, Category, Response, and Timestamp. The Action Log tab contains Name, Email, Category, Action Taken, and Timestamp.

11. Task 3 — Switch, Responses and Email

The Switch node uses the dynamic Category field and routes to four exact branches:

Condition	Branch
Category = Time Management	Time Management
Category = Lack of Focus	Lack of Focus
Category = Overwhelm	Overwhelm
Category = Tool Confusion	Tool Confusion

Each branch creates a personalized response. For example, the Time Management branch points students toward the toolkit's AI-assisted planning structures and study workflow systems; the Tool Confusion branch points toward organized prompt templates and workflow structures.

Email uses the student's submitted address and dynamic fields such as {{ $json["Name"] }} and {{ $json["Response"] }}. Gmail SMTP was configured using an App Password; secret credentials are not documented.

12. Task 3 — Lead Update, Action Log and Testing

Because the initial Leads row is created before the personalized Response exists, an update stage writes the Response back into the matching lead using Email as the matching field. The Action Log records Name, Email, Category, Action Taken, and Timestamp.

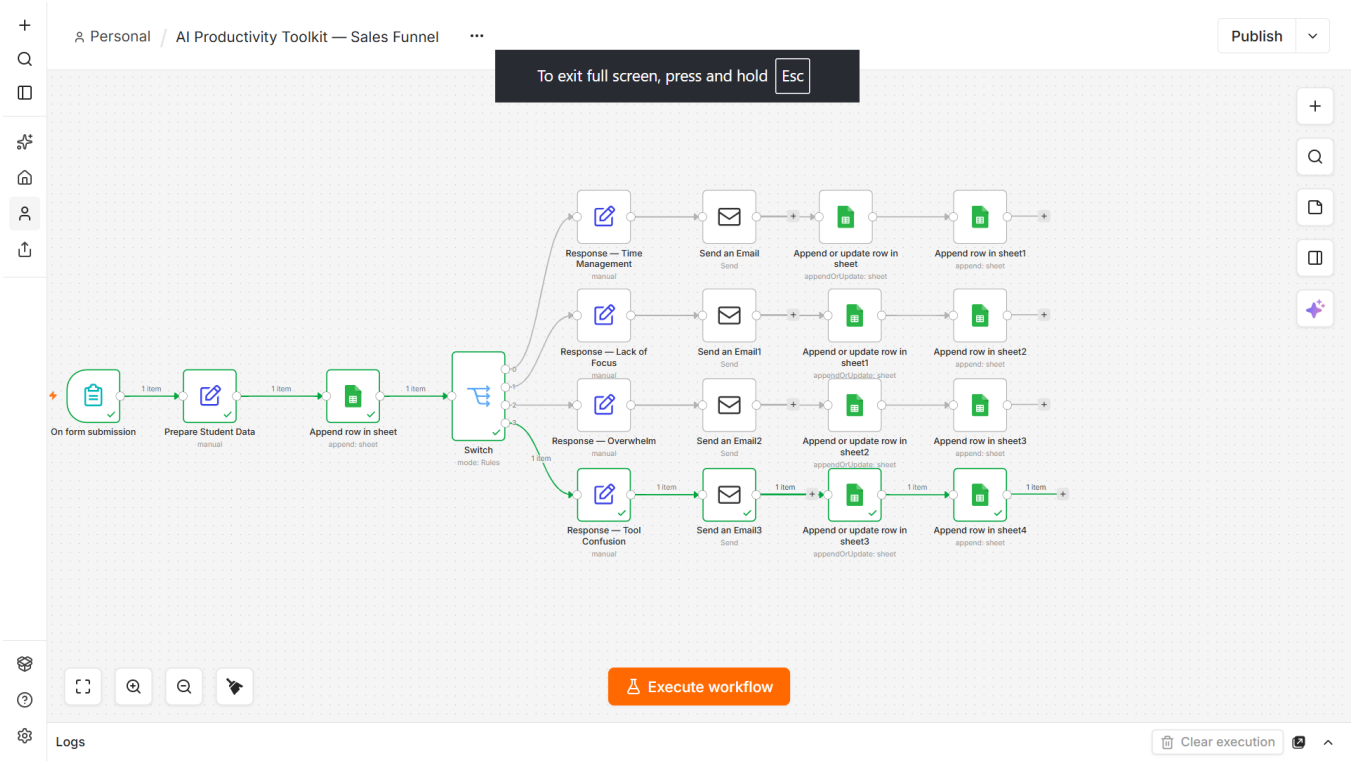
The tested action value was **Personalized email sent**.

Test	Category	Response	Action Log	Result
1	Time Management	Executed	Recorded	PASS
2	Lack of Focus	Executed	Recorded	PASS
3	Overwhelm	Executed	Recorded	PASS
4	Tool Confusion	Executed	Recorded	PASS

All four required challenge routes were tested successfully. The workflow evidence also shows the form, data preparation, Google Sheets, Switch, four response branches, Email nodes, lead updates, and Action Log nodes.

13. Task 3 — Final n8n Workflow Evidence

The final workflow screenshot below documents the implemented automation structure.



Final n8n workflow implementation.

14. Combined Refinement & Quality-Control Record

Across the three tasks, refinement was treated as part of the system rather than a final cosmetic step.

Task	Initial issue / risk	Refinement
Task 1	Message could be abstract and differentiation was expl	Added concrete student context, clearer blank-chat problem, component-s
Task 2	Scene 3 initially displayed unsupported subcategories	Regenerated the laptop interface to show only the four defined product co
Task 2	Need continuity across five images.	Locked Ananya's identity, wardrobe, environment, lighting, composition, a
Task 3	Fixed routing could send every test through the same b	Used dynamic {{ $json["Category"] }} routing.
Task 3	Response was created after the initial lead row.	Added an update stage to write the Response back to the matching lead.
Task 3	Need operational traceability.	Added Action Log records for the automated follow-up.

The overall quality-control principle was: **Generate** → **Review** → **Compare against requirements** → **Check product scope** → **Refine** → **Test** → **Document.**

15. Final System Integration

The three tasks are connected rather than independent:

Layer	What it does	Output
Task 1 — Messaging	Understands the buyer, positions the toolkit, handles objections, and generates the sales message	Headline, interactive value propositions, CTA
Task 2 — Visual AI	Turns the message into a consistent five-scene visual narrative	Five cinematic scenes + storyboard
Task 3 — Automation	Turns a student response into a structured operational workflow	Form → Sheets → Switch → Response → Email → Log

In simple language: **Task 1 decides what to say, Task 2 decides how to show it, and Task 3 handles what happens when a student responds.**

16. Ethical Guardrails

The final project intentionally avoids: guaranteed productivity improvements; guaranteed time savings; invented statistics; better-grade or academic-success promises; financial-return promises; fake testimonials; artificial scarcity; manipulative urgency; claims that the toolkit is better than ChatGPT; claims that ChatGPT cannot perform the tasks; and features beyond the four defined components.

This keeps the campaign focused on demonstrating the actual value of organized, reusable structures rather than relying on unsupported outcomes.

17. Final Project Outcome

Project 4 produced a complete three-layer AI-powered micro digital business system for the AI Productivity Toolkit for Students:

1. **Ethical sales messaging** grounded in buyer research and iterative refinement.

2. **Five-scene cinematic visual storytelling** with a locked character and product-scope controls.

3. **n8n lead-handling automation** connecting a free-preview form to Google Sheets, classification, personalized responses, email, lead updates, and action logging.

Final project status: COMPLETED.

18. Viva / Presentation Master Answers

What did you build?
I built an AI-powered micro digital business system for the AI Productivity Toolkit for Students, covering messaging, visual storytelling, and automated lead handling.

Why are the three tasks connected?
Task 1 creates the strategic sales message, Task 2 converts that message into visuals, and Task 3 handles student responses through automation.

What was the biggest Task 1 learning?
AI access itself is not the value proposition. The message focuses on organized, reusable structures for student workflows.

What was the biggest Task 2 refinement?
Scene 3 initially showed unsupported subcategories, so it was regenerated to display only the four defined product components.

Why did you use a Switch in Task 3?
To route a student's submission into one of four personalized response branches based on the selected productivity challenge.

What did you learn from the complete project?
A strong AI system needs structured inputs, clear constraints, iterative review, testing, and documentation—not just generation.

19. Final Summary

The completed project moves from strategy to creative execution to operational automation:

```
Buyer Insight → Ethical Sales Message → Cinematic Story → Student Preview → Automated Classification → Personalized Follow-Up → Action Log
```

The final system demonstrates how AI can support a digital-product campaign while keeping the product definition fixed, the messaging transparent, the visuals consistent, and the automation testable.
